

## ABSTRACT

Provided is a tantalum sputtering target manufactured by working a molten and cast tantalum ingot or billet through forging, annealing and rolling, wherein the  
5 structure of the tantalum target comprises a non-recrystallized structure. The tantalum sputtering target having a high deposition speed and excellent uniformity of film, producing less arcings and particles and having excellent film forming properties, and the method capable of stably manufacturing the target can be provided by improving and devising plastic working steps such as forging and  
10 rolling, and the heat treatment step.
